## What we bring

We combine discovery, product thinking, engineering and ongoing improvement to help teams make better use of their information, processes and customer touchpoints.

- A direct, founder-led relationship from early scoping through delivery.
- Technology decisions shaped by the operating need, not a generic tool catalogue.
- Attention to access control, information handling, integration and maintainability.
- A practical start: clarify outcomes, users, constraints and the first useful release.

# Technology delivery built around real operations

Our services can be combined into a focused project, an internal platform, a client-facing service or a longer-term improvement programme.

| Capability                  | How we apply it                                                                                                               |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Custom software development | Operational systems, client portals, administrative tools and workflow solutions shaped around the way a team actually works. |
| Enterprise web applications | Responsive web platforms for public services, client self-service, registration, secure administration and reporting.         |
| Mobile applications         | Android and iOS-ready experiences that give teams and customers useful access to key workflows and information.               |
| Cloud, back-end and APIs    | Back-end architecture, cloud foundations, API integration and data flows designed for dependable operations.                  |
| Automation and AI workflows | Focused automation to reduce repetitive administration, improve consistency and create clearer operational visibility.        |
| Dashboards and data systems | Real-time administrative views, records workflows and reporting foundations that support better decisions.                    |

## A disciplined path from need to working system

- 1 Discover: clarify the operational objective, users, information, existing systems and decision-makers.
- 2 Shape: define the first useful scope, delivery plan, risks, responsibilities and success measures.
- 3 Build: design, develop, test and demonstrate the solution in practical increments.
- 4 Launch: prepare people, access, support and the handover needed for the system to become useful.
- 5 Improve: learn from real use and prioritise the next changes that protect or increase the value created.

### Governance and information handling

We treat privacy, access control, auditability and operational risk as delivery concerns. The detail is shaped to the project context. SHIZZL HOLDINGS has published its Privacy Notice, PAIA Manual, Website Terms and Accessibility Statement at [shizzlholdings.co.za](https://shizzlholdings.co.za).

### Selected proof

Our public client showcase distinguishes products and websites developed for client organisations from service testimonials. Current proof and the right supporting information can be shared through the appropriate project or procurement channel.

### A clear next step

Tell us what needs to improve, who needs to use it and what a successful outcome looks like. We will help identify a practical first release and the information required to plan it.
